**Abstract :** Organizational Behavior (OB) is the study of human behavior in organizational settings, the interface between human behavior and the organization, and the organization itself. Organizational Behavior researchers study the behavior of individuals primarily in their organizational roles. One of the main goals of organizational behavior is to revitalize organizational theory and develop a better conceptualization of organizational life. As a multi-disciplinary field, organizational behavior has been influenced by developments in a number of allied disciplines including sociology, psychology, economics, and engineering as well as by the experience of practitioners.

### Introduction

Organizational behavior is the study of both group and individual performance and activity within an organization. This area of study examines human behavior in a work environment and determines its impact on job structure, performance, communication, motivation, leadership, etc. It is the systematic study and application of knowledge about how individuals and groups act within the organizations where they work. OB draws from other disciplines to create a unique field. When we review topics such as personality and motivation, we will again review studies from the field of psychology. The topic of team processes relies heavily on the field of sociology. When we study power and influence in organizations, we borrow heavily from political sciences. Even medical science contributes to the field of Organizational Behavior, particularly in the study of stress and its effects on individuals.

There is increasing agreement as to the components or topics that constitute the subject area of OB. Although there is still considerable debate as to the relative importance of change, there appears to be general agreement that OB includes the core topics of motivation, leader behavior, and power, interpersonal communication, group structure and processes, learning, attitude development and perception, change processes, conflict, work design, and work stress.

Analyzing these new organizational forms, sociologist Max Weber described bureaucracy as an ideal type of organization that rested on rational-legal principles and maximized technical efficiency. In the 1890's; with the arrival of scientific management and Taylorism, Organizational Behavior Studies was forming it as an academic discipline. Failure of scientific management gave birth to the human relations movement which is characterized by a heavy emphasis on employee cooperation and morale.

Human Relations Movement from the 1930's to 1950's contributed to shaping the Organizational Behavior studies. Administrative Behavior introduced a number of important concepts to the study of organizational behavior, most notably decision making. Simon along with Chester Barnard; argued that people make decisions differently in organizations than outside of them. Simon was awarded the Nobel Prize in Economics for his work on organizational decision making. In the 1960s and 1970s,
