

## A brief study on professional capabilities for making decisions and managing their emotions

GEETA SHARMA

ASSISTANT PROFESSOR IN PEDAGOGY OF MATHEMATICS

K. C. COLLEGE OF EDUCATION, GANAUR, SONEPAT

### ABSTRACT

This study article focuses on the ability of professionals in terms of making choices and controlling their emotions. Please present your research study centred on the Sonipat area in the state of Haryana. Throughout the course of this investigation, a sample of forty different respondents was collected. Methods of analysis such as the mean, standard deviation, t-test, and Anova have been employed for the data analysis. The results of the research indicate that there is a connection between gender and one's professional capacities, such as decision-making and emotional control, and the study found that this connection exists.

**KEYWORDS:** Professional capabilities, making decisions, emotions.

### INTRODUCTION

In both one's personal and professional life, one must sometimes make important choices. The self and one's family are intimately connected to one's private existence. Although one's personal life is separate from their professional life, both are connected to the world in which one works for a living. The choices that were made have an effect on a large number of individuals and might have far-reaching repercussions. There are certain choices that may be made quickly and easily, while others need for a great deal of methodical consideration and careful preparation before the choice can be made and put into action. People's approaches to decision-making are as varied as the individuals themselves. Some individuals base their choices only on their own points of view, while others may put off making a choice until there is no other alternative than to make the choice. Some individuals are unable of making decisions on their own and must instead rely on the guidance and input of others before arriving at a conclusion. People are varied in the ways that they approach and make decisions, and each of these approaches has its advantages and disadvantages. The context and scenario that calls for a choice, the intellect of the person making the decision, and the repercussions of the decision that is made are all elements that may have an impact on the decision-making style that someone uses. Another important component that has a big impact on the manner in which decisions are made is the mental and emotional condition of the person making the decisions. The ability to make decisions that are more effective and have a greater impact requires maintaining emotional equilibrium. The development of one's emotional intelligence is beneficial for both the management of one's own feelings and the management of one's interactions with other people. A person who is emotionally intelligent will approach decision-making, whether it be on a personal or professional level, with extreme deliberation and the benefit of both foresight and hindsight. As a direct result of this, his mode of decision making will also be dependent on the emotional state he is now in.

The researcher looked through a large number of studies that were connected to decision-

making and emotional intelligence, but she was unable to identify a single one that investigated the connection between decision-making and the emotional intelligence of professionals. The connection that exists between the ability to make judgements and one's emotional intelligence is one that is not only of great significance but also has a significant bearing on the choices that a person ultimately makes in any given circumstance. Because of this, it became clear that further research needed to be done to investigate the connection between the decision-making ability of professionals and their emotional intelligence. This research will assist in guiding professionals in making judgements that are appropriate and timely within their professions, which will improve the quality of both interpersonal and intrapersonal interactions. The current research was suggested because it would be helpful in discovering the link that is present between decision-making and the emotional intelligence of professionals working in a variety of industries. After it is finished, the current study will assist decision-makers, administrators, academics, educators, professional trainers, and researchers in planning their next steps for the achievement of persons as professionals.

### **Conceptual Background**

The social and interconnected character of human people, both in their private and professional life, is hardwired into our species. They have distinct responsibilities at home, in the workplace, in the company of friends and family, and in society as a whole. There are a number of characteristics, including intelligence, behaviour, and emotions, that contribute to the success of this connection. In order to deal with difficult circumstances and make the most of the situation, one must learn to control their emotions and use their knowledge. Human beings are capable of feeling a wide range of emotions. These feelings have varying degrees of impact on how people behave. Individuals vary in the manner in which they communicate their feelings. It is essential for a person to be able to recognise his own emotions and have the ability to effectively regulate them. It is necessary for people to be able to grasp the feelings that are present in other people in order for them to be able to deal with those feelings in an efficient manner.

Everyone should put a strong emphasis on developing their EQ (emotional quotient). It enables individuals to make judgements that are acceptable, respond to events in a sensible manner, and successfully manage their interpersonal connections. The ways in which one's own emotions and those of others are regulated are both influenced by emotional intelligence. In addition to this, it has an effect on the activities and behaviours of every single human person. It gives people the ability to make judgements in a variety of settings, particularly in their professional life.

### **Emotions**

As a person reacts to any event, whether it is something that happened to them inside or something that happened to them outside, emotions might arise. Emotions are the body's way of reacting physiologically to a circumstance. They are complicated in their very make-up. Individuals go through both psychological and physiological changes as a direct result of their emotional experiences. To paraphrase what David G. Meyers has stated, the fundamental elements of emotions are "physiological arousal, expressive behaviours, and conscious experiences." [Citation needed] An person is capable of experiencing both pleasant and

negative feelings at the same time. Primary emotions include things like love, happiness, fear, and fury, whereas secondary emotions include things like sadness and worry (Example- shame, pride, sympathy). The fundamental feelings that are experienced by human beings are both natural and unlearned. Experience is the only way to acquire knowledge of the feelings that are of a secondary character. The connection that exists between two individuals is substantially impacted by the emotions that are shared by those two persons. Love, happiness, surprise, anger, fear, sorrow, disgust, and surprise are the fundamental emotions. Love, happiness, and surprise are also fundamental. These are applicable to everyone. In addition, human beings are capable of experiencing higher-order, more self-aware emotions. These are things that people go through due to the fact that they are unique. Included in this category are feelings such as guilt, jealousy, pride, embarrassment, and humiliation. Both the expressing of feelings and keeping those feelings in check are highly crucial skills to have. The process of adjusting one's emotional state to a level of intensity that is both comfortable and conducive to the accomplishment of one's objectives is an example of emotional self-regulation. This process involves the adoption of a variety of tactics that may assist in this adjustment. One must exert their own volitional effort in order to achieve emotional self-regulation.

In 1970, Paul Eckman developed a list of the six fundamental feelings that are shared by individuals of all civilizations. "Happiness, sorrow, contempt, fear, surprise, and fury" were the names given to these feelings. Later on, he added feelings such as pride, humiliation, embarrassment, and enthusiasm to the list of feelings that people experience.

Nobody can avoid feeling the effects of other people's emotions since everyone has them and everyone experiences them. It is not possible for a person to sustain themselves in a state of heightened emotions for an extended amount of time. The length of time that an individual remains in a certain emotional state varies greatly from person to person.

When people are unable to control their feelings, it may often have extremely significant and unfavourable repercussions for them. It is possible for individuals to become aware of their own emotions and to understand the emotions that are present in other people. Because of this, human beings are distinct and more remarkable than computers that are endowed with Artificial Intelligence. Emotions are something that can only be understood and controlled by human beings; machines can't do either. This is due to the fact that humans possess Intelligence, a factor that has a significant impact on both the expression and comprehension of feelings.

### **Decision Making**

There are many paths to choose in life. It is up to us to make intelligent decisions. People make choices on a daily basis about their jobs, relationships, finances, and other aspects of their personal and professional life. On the basis of one's requirements and their own best judgement, one must choose, from among the many accessible choices, the most appropriate solution. The term "Decision" originates from the Latin word "decisio," which means "to choose." This term meaning "to cut from" or "to separate from." To "decide" anything is synonymous with "coming to a decision" or "passing a resolution."

A cognitive process is involved in the act of deciding anything. Out of the many distinct options that are accessible, one particular path of action is selected. A relatively small number of choices can be made with one hundred percent assurance. The vast majority of choices need

facing at least some degree of ambiguity or danger. At every juncture in their life, people are confronted with choices that must be made. The vast majority of these choices are simple and straightforward to implement. There are several circumstances that provide problems and challenges. When faced with such challenges, making decisions might be challenging. In circumstances like these, it is very essential for individuals to have a solid understanding of the steps involved in the decision-making process. In most cases, the procedure for making decisions is tailored specifically to the problem that has to be addressed. A substantial amount of creative thinking is required for sound decision making.

According to James Stoner, "decision-making" refers to the process of "identifying and selecting a particular course of action for the resolution of a given issue."

The findings of Trewartha and Newport are as follows: "The process of making a decision entails selecting a plan of action from among two or more feasible options in order to find a solution to a particular situation,"

It is essential vital you comprehend the possibility that the 'right' selection as a choice will not be included among the alternatives that are examined. There is a possibility that the 'right' choice is not shown to the user because it does not exist or because it has not been investigated. As a consequence of this, the choice that is made right now could need to be revised or adjusted at some point in the future. Every choice has some degree of danger and unpredictability. It is imperative that it be recognised that no choice can ever be made with full and utter conviction since, in most cases, there is no exhaustive list of options that can be weighed and considered throughout the process of decision-making. It's likely that the alternatives that are being considered won't measure up to the quality of those that were purposefully or accidentally omitted from the list of potential solutions. In order to make the best choice possible, it is essential to have access to all of the relevant information as well as potential solutions. This, however, may not be doable for a variety of reasons, including a lack of available time and an inability to fully comprehend all of the potential solutions. When it comes time to make a choice, most people go with the option that they believe will have the most positive impact on their situation or the one that best aligns with their needs, wants, and core beliefs. Every choice must be evaluated in light of the circumstances around it as well as certain established criteria for making decisions.

### **OBJECTIVES OF THE STUDY**

The framing of objectives helps in defining the course of action. It helps in planning the research in an objective manner. The objectives of the present study are as follows:

- 1: To find the Emotional Intelligence of Professionals.
- 2: To find the decision making attitude of Professionals.

### **HYPOTHESES**

- There is no significant difference in the Emotional Intelligence of Professionals with respect to gender.

### **RESEARCH METHODOLOGY**

#### **Study Deign**

The current research largely consists of descriptive and analytical components.

**Study Area**

In the presented research work, we study on mainly Sonipat, Haryana State.

**Sample Size**

40 will be the sample size of present research work.

**Sampling Technique**

In the present research work, for sample selection Experience Sampling Methods are used which includes face to face interaction.

**Data Collection Procedure:**

Present study is based mainly on Primary data. Personal interactions, interviews and questionnaire have been used to collect the analytical data.

**Data Analysis Procedure:**

- Mean, SD
- SPSS
- One sample t test

**DATA ANALYSIS**

**Table 1 Difference in emotional intelligence of students with reference to their gender**

Group Statistics					
GENDER		N	Mean	Std. Deviation	Std. Error Mean
EMOTIONAL INTELLIGENCE	MALE	20	1.2	0.41	0.092
	FEMALE	20	2.3	0.47	0.105

The findings of an inquiry into the descriptive status of emotional intelligence in connection to gender of the respondents are shown in the table that is located above. These findings may be found by looking at the data. The findings of this study indicate that the mean score and standard deviation of females in respect to emotional intelligence are greater than those of males in relation to emotional intelligence. In addition, the mean score of females is higher than the standard deviation of males.

**Table 1(A) Difference in Urban and rural background of students with reference to Social competency of Prospective teachers: Independent Samples Test**

Independent Samples Test									
		Levene's Test for Equality of Variances		t-test for Equality of Means					
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	

EMOTIONAL INTELLIGENCE	Equal variances assumed	2.083	0.157	-7.883	38	0	-1.1	0.14
	Equal variances not assumes			-7.883	37.319	0	-1.1	0.14

Since P value < 0.05, null hypothesis is rejected in the case of emotional intelligence.

It has been discovered that there is a considerable difference between the genders in terms of emotional intelligence. This conclusion was reached on the basis of the results of the analysis that was done on table no. 1(A). As the significance value of this data analysis is 0.000, which is much lower than the standard significance value of data analysis, which is 0.05, the null hypothesis cannot be accepted.

**Table 1(B) Difference in Urban and rural background of students with reference to Social competency of Prospective teachers: ANOVA**

ANOVA					
EMOTIONS					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	13.069	2	6.535	37.597	0
Within Groups	6.431	37	0.174		
Total	19.5	39			

Since P value < 0.05, null hypothesis is rejected in the case of emotional intelligence.

It has been discovered that there is a considerable difference between the genders in terms of emotional intelligence. This conclusion was reached on the basis of the results of the analysis that was done on table no. 1(A). As the significance value of this data analysis is 0.000, which is much lower than the standard significance value of data analysis, which is 0.05, the null hypothesis cannot be accepted.

### CONCLUSION

This study article focuses on the ability of professionals in terms of making choices and controlling their emotions. The results of the research indicate that there is a connection between gender and one's professional qualities, specifically with regard to the ability to make choices and to control one's emotions.
